# Robot Learning Weekly Exercise 8

Marc Toussaint  $&$  Wolfgang Hönig Learning & Intelligent Systems Lab, Intelligent Multi-Robot Coordination Lab, TU Berlin Marchstr. 23, 10587 Berlin, Germany

Summer 2024

#### 1 Literature: Neural Lander

Here is a paper that claims to combine safety and learning:

G. Shi, X. Shi, M. O'Connell, R. Yu, K. Azizzadenesheli, A. Anandkumar, Y. Yue, and S.-J. Chung. Neural Lander: Stable Drone Landing Control Using Learned Dynamics. In 2019 International Conference on Robotics and Automation (ICRA), pages 9784–9790. IEEE. URL: <https://ieeexplore.ieee.org/document/8794351/>, [doi:10.1109/ICRA.](https://doi.org/10.1109/ICRA.2019.8794351) [2019.8794351](https://doi.org/10.1109/ICRA.2019.8794351)

The paper is at the intersection of control theory and learning and several other works exist to extend the idea to new domains.

Questions:

a) Take a look at the proposed control law (8) and (12). What exactly is learned and how is the learned function applied in the controller?

Learned is  $\hat{f}_a$ . This is added as a feedforward term in the controller.

b) The paper shows exponential stability, i.e., that the position error will go to zero quickly (around (14)). Explain in words the variables  $\epsilon_m$ ,  $L_a$ , and  $\rho$ . Explain how this equation tells us that the learned function needs to be Lipschitz-bounded.

 $\epsilon_m$ : Approximation error of residual force.

 $L_a$ : Lipschitz-bound.

ρ: One-step difference of control signal

We need  $\lambda_{min}(K_v) > L_a \rho$ . Since  $K_v$  is a gain matrix that can not be arbitrarily large due to actuation limits, we need to bound  $L_a$ .

c) Write down pseudo code on how one can use SGD or Adam and train a basic feed forward neural network with ReLU activation to have a bounded Lipschitz constant. (Use the information in the paper from III.B.)

Run regular SGD gradient update. For each layer W from  $1 \dots L + 1$ : .. Compute maximum singular value  $\sigma(W)$ 

- .. Update weights to  $\bar{W} = W/\sigma(W) \cdot \gamma^{\frac{1}{L+1}}$
- d) What needs to change if tanh activation functions are used to achieve the same Lipschitz-bound?

Compute the Lipschitz norm of tanh, which is 1 (same as for ReLu). Thus, nothing changes.

### 2 Fun With Definitions

In the safe learning survey paper and the lecture, the robot dynamics were defined as  $x_{k+1} = f_k(x_k, u_k, w_k)$ . In RL and MDPs a transition model is used instead as  $p(x_{k+1}|x_k, u_k)$ . Here we look at the relationship of the two.

a) Consider an MDP with states s, t, g and actions a, b. The transition model is  $p(t|s, a) = 0.1, p(g|s, a)$  $0.9, p(g|s, b) = 0.2, p(s|s, b) = 0.8, p(t|t, a) = 1, p(t|t, b) = 1, p(g|g, a) = 1, p(g|g, b) = 1$ . The goal for the robot starting at s is to avoid t and reach g. What is a safe sequence of actions here? Write down an equivalent formulation using the notation in the paper/lecture.

Safe sequence is  $bbb\dots$ 

 $x_{k+1} =$  $\sqrt{ }$  $\begin{matrix} \end{matrix}$  $\overline{\mathcal{L}}$  $t$  if  $x_k = s \wedge u_k = a \wedge w < 0.1$  $g \quad if x_k = s \wedge u_k = a \wedge w \geq 0.1$  $g \quad if x_k = s \wedge u_k = b \wedge w < 0.2$ s  $if x_k = s \wedge u_k = b \wedge w \ge 0.2$  $x_k$  otherwise

```
with w_k \sim U(0, 1).
```
b) Consider 1D single-integrator dynamics (i.e., state is position and the velocity can be controlled directly) and W zero-mean Gaussian:  $x_{k+1} = x_k + u_k \cdot \Delta t + w_k$ , where  $w_k \sim N(0, \sigma^2)$ . Write down an equivalent transition model.

 $p(x_{k+1}|x_k, u_k) \sim N(x_k + u_k \cdot \Delta t, \sigma^2)$ 

c) The use of  $f_k$  allows hybrid models, where the dynamics might change over time. How can such changes be encoded in the MDP transition model?

Create a transition model for each  $f_k$  and connect the different transition models whenever a switch in the hybrid system occurs.

d) We defined the cost as  $J(x_{0:N}, u_{0:N-1}) = l_N(x_N) + \sum_{k=0}^{N-1} l_k(x_k, u_k)$ . How can a discount factor be encoded here?

 $l_k = -\gamma^k r_k(x_k, u_k)$ 

## 3 Working With Code: safe-control-gym

One implementation / benchmark for this is safe-control-gym, see

Z. Yuan, A. W. Hall, S. Zhou, L. Brunke, M. Greeff, J. Panerati, and A. P. Schoellig. Safe-Control-Gym: A Unified Benchmark Suite for Safe Learning-Based Control and Reinforcement Learning in Robotics. 7(4):11142–11149. URL: <https://ieeexplore.ieee.org/document/9849119/>, [doi:10.1109/LRA.2022.3196132](https://doi.org/10.1109/LRA.2022.3196132)

for the paper and <https://github.com/utiasDSL/safe-control-gym> for the code on github.

You may install it locally following the instructions to try it, although some questions can also be answered just by reading the code.

```
git clone https://github.com/utiasDSL/safe-control-gym.git
cd safe-control-gym
pip install -e .
```
- a) Group the available algorithms (see the Readme file in the repo) using the taxonomy/grouping from the lecture (you may ignore the ones that have nothing to do with safety). Try to find academic references for each algorithm.
	- Not related to safety: PID, LQR, iLQR, Linear MPC, SAC, PPO, DDPG
	- Safely learn uncertain dynamics:
		- GP MPC
		- Safe Explorer
	- RL that encourages safety and robustness:
- Robust Adversarial Reinforcement Learning (RARL)
- Robust Adversarial Reinforcement Learning using Adversarial Populations (RAP)
- Safety Certification:
	- MPSC
	- CBF
	- Neural Network CBF
- b) One interesting aspect of the toolbox is that it provides analytical models for the dynamics and constraints. Where are these models located for the three default systems (cartpole, quadrotor2d, quadrotor3d)?
	- Cartpole [https://github.com/utiasDSL/safe-control-gym/blob/0c0274de96b24b4d780f67c0f04f268b3e178f12/](https://github.com/utiasDSL/safe-control-gym/blob/0c0274de96b24b4d780f67c0f04f268b3e178f12/safe_control_gym/envs/gym_control/cartpole.py#L380-L427) [safe\\_control\\_gym/envs/gym\\_control/cartpole.py#L380-L427](https://github.com/utiasDSL/safe-control-gym/blob/0c0274de96b24b4d780f67c0f04f268b3e178f12/safe_control_gym/envs/gym_control/cartpole.py#L380-L427)
	- Quadrotor 2D [https://github.com/utiasDSL/safe-control-gym/blob/0c0274de96b24b4d780f67c0f04f268b3e178](https://github.com/utiasDSL/safe-control-gym/blob/0c0274de96b24b4d780f67c0f04f268b3e178f12/safe_control_gym/envs/gym_pybullet_drones/quadrotor.py#L492-L510)f12/ [safe\\_control\\_gym/envs/gym\\_pybullet\\_drones/quadrotor.py#L492-L510](https://github.com/utiasDSL/safe-control-gym/blob/0c0274de96b24b4d780f67c0f04f268b3e178f12/safe_control_gym/envs/gym_pybullet_drones/quadrotor.py#L492-L510)
	- Quadrotor 3D [https://github.com/utiasDSL/safe-control-gym/blob/0c0274de96b24b4d780f67c0f04f268b3e178](https://github.com/utiasDSL/safe-control-gym/blob/0c0274de96b24b4d780f67c0f04f268b3e178f12/safe_control_gym/envs/gym_pybullet_drones/quadrotor.py#L511-L533)f12/ [safe\\_control\\_gym/envs/gym\\_pybullet\\_drones/quadrotor.py#L511-L533](https://github.com/utiasDSL/safe-control-gym/blob/0c0274de96b24b4d780f67c0f04f268b3e178f12/safe_control_gym/envs/gym_pybullet_drones/quadrotor.py#L511-L533)
- c) Consider the example for a safety filter in examples/mpsc for a 2D quadrotor. How can you constrain the states and actions of the filter? Constrain the  $x$  coordinate to be within  $-1$  and  $2$  and show the resulting plot(s), compared to the default setting (your choice of "unsafe" controller).

Constraints can be defined in a config file, see [https://github.com/utiasDSL/safe-control-gym/blob/](https://github.com/utiasDSL/safe-control-gym/blob/0c0274de96b24b4d780f67c0f04f268b3e178f12/examples/mpsc/config_overrides/quadrotor_2D/quadrotor_2D_track.yaml#L69-L87) [0c0274de96b24b4d780f67c0f04f268b3e178f12/examples/mpsc/config\\_overrides/quadrotor\\_2D/quadrotor\\_2D\\_](https://github.com/utiasDSL/safe-control-gym/blob/0c0274de96b24b4d780f67c0f04f268b3e178f12/examples/mpsc/config_overrides/quadrotor_2D/quadrotor_2D_track.yaml#L69-L87) [track.yaml#L69-L87](https://github.com/utiasDSL/safe-control-gym/blob/0c0274de96b24b4d780f67c0f04f268b3e178f12/examples/mpsc/config_overrides/quadrotor_2D/quadrotor_2D_track.yaml#L69-L87).

d) Consider the example for safe RL (examples/rl). For safe explorer ppo there is a pre-training and a regular training. What exactly is the difference between those two? How can you specify what safety means for your application?

The main script for training first executes pre-training [https://github.com/utiasDSL/safe-control-gym/blob/](https://github.com/utiasDSL/safe-control-gym/blob/0c0274de96b24b4d780f67c0f04f268b3e178f12/examples/rl/train_rl_model.sh#L24-L34) [0c0274de96b24b4d780f67c0f04f268b3e178f12/examples/rl/train\\_rl\\_model.sh#L24-L34](https://github.com/utiasDSL/safe-control-gym/blob/0c0274de96b24b4d780f67c0f04f268b3e178f12/examples/rl/train_rl_model.sh#L24-L34).

Pretrain has additional constraints [https://github.com/utiasDSL/safe-control-gym/blob/](https://github.com/utiasDSL/safe-control-gym/blob/0c0274de96b24b4d780f67c0f04f268b3e178f12/examples/rl/config_overrides/quadrotor_2D/safe_explorer_ppo_quadrotor_2D_pretrain.yaml#L10-L21) [0c0274de96b24b4d780f67c0f04f268b3e178f12/examples/rl/config\\_overrides/quadrotor\\_2D/safe\\_explorer\\_ppo\\_](https://github.com/utiasDSL/safe-control-gym/blob/0c0274de96b24b4d780f67c0f04f268b3e178f12/examples/rl/config_overrides/quadrotor_2D/safe_explorer_ppo_quadrotor_2D_pretrain.yaml#L10-L21) [quadrotor\\_2D\\_pretrain.yaml#L10-L21](https://github.com/utiasDSL/safe-control-gym/blob/0c0274de96b24b4d780f67c0f04f268b3e178f12/examples/rl/config_overrides/quadrotor_2D/safe_explorer_ppo_quadrotor_2D_pretrain.yaml#L10-L21).

Safety is specified as before, e.g., in [https://github.com/utiasDSL/safe-control-gym/blob/](https://github.com/utiasDSL/safe-control-gym/blob/0c0274de96b24b4d780f67c0f04f268b3e178f12/examples/rl/config_overrides/quadrotor_2D/quadrotor_2D_track.yaml#L67-L91) [0c0274de96b24b4d780f67c0f04f268b3e178f12/examples/rl/config\\_overrides/quadrotor\\_2D/quadrotor\\_2D\\_track.](https://github.com/utiasDSL/safe-control-gym/blob/0c0274de96b24b4d780f67c0f04f268b3e178f12/examples/rl/config_overrides/quadrotor_2D/quadrotor_2D_track.yaml#L67-L91) [yaml#L67-L91](https://github.com/utiasDSL/safe-control-gym/blob/0c0274de96b24b4d780f67c0f04f268b3e178f12/examples/rl/config_overrides/quadrotor_2D/quadrotor_2D_track.yaml#L67-L91).
